

# Python II

## ① Metrics: Accuracy: (Binary Classifier)

→ Accuracy:  $\frac{Tp}{Total}$

True Positives  
total  
ex:  $\frac{20}{100} = 0,2$

→ Precision:  $\frac{Tp}{Tp+FP}$

4 Data:

|      |     |       |
|------|-----|-------|
| ○○○○ | 75% | ~.90% |
| ○○○○ | 50% | ~.10% |

\* Binario 2 } 50%  
60/40 → 10%

→ Recall:  $\frac{Tp}{Tp+TN}$

True Positives  
true posit + false pos

True Positives  
true positive + true negative

## ② Probability Threshold:

# ③ ROC (Receiving Operation Characteristic)

Variable: Threshold!

| Model | Thre | TP | TN |
|-------|------|----|----|
| 0.1   | 0.1  | 1  | 1  |
| 0.2   | 0.2  | 1  | 1  |
| 0.3   | 0.3  | 1  | 1  |
| 1     | 1    | 1  | 1  |

\* Area under the curve:

Better  
↑  
AUC

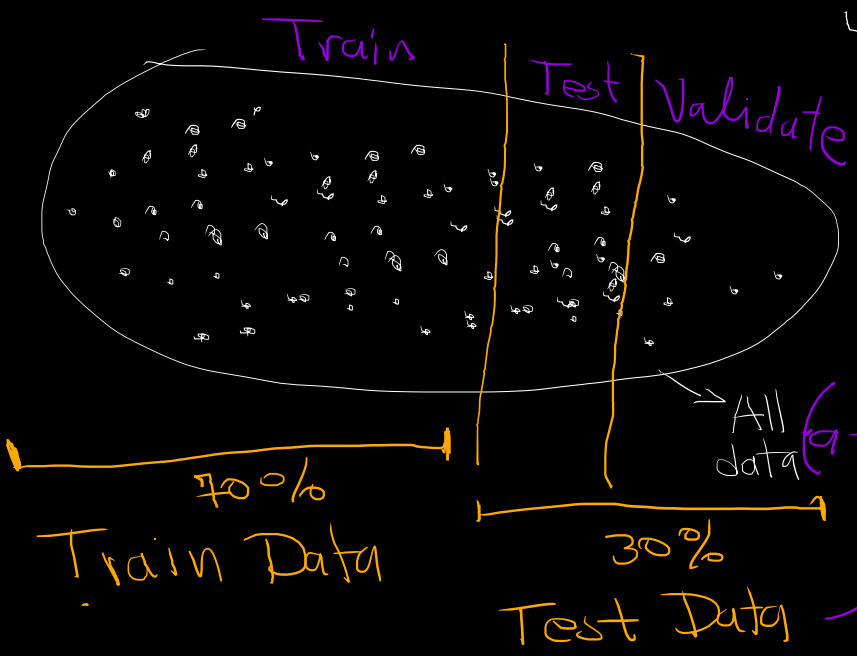

# ④ Real Life Data Set :

Dataset size : 5

Per category : > 60,000

- Better Models, Few data
- How handle Big Data!

Big Data = BD

# \* Practice: Real Life Pipeline AI/ML

## \* MNIST database:

1 2 3

DB

handwriting digits

→ Use Tensorflow Muist (Edu)

→ Using other images

$[0]$  scalar 0-D  
 $[0000]$  vector 1-D  
 $\begin{bmatrix} 0000 \\ 0000 \end{bmatrix}$  matrix 2-D  
 $\begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}$  3-D  
 $\dots$  4-D

→ Tensorflow!!!

## \* Train Data:

$[0]$   $[1]$   $[2]$

## \* Labels

$[0, 1, 2, 9, \dots]$

X flatten

for  $[1, 0, 0, 0, \dots]$

$\begin{bmatrix} 0 \\ \vdots \end{bmatrix}$

$\begin{bmatrix} [0] \\ [1] \\ [2] \\ \vdots \end{bmatrix} \rightarrow \begin{bmatrix} L & 0 & 1 \\ L & 1 & 1 \\ L & 2 & 1 \end{bmatrix}$

$$2^n = 2, 4, 8, 16, 32$$

$$1024$$

GPT

FFT  $2^n$
